

Build a production-quality Web3 gaming portal for:

LIL BLUNT: THE SMOKE REALM

Domain:

<https://smokegame.win>

IMPORTANT PLATFORM CONSTRAINTS

This application is being built on Caffeine AI / Internet Computer.

Use Caffeine's native architecture:

- React + TypeScript frontend
- ICP / Motoko backend where persistent application data is required
- Internet Identity for authentication
- Persistent ICP-native data storage
- Responsive web application
- Component-driven architecture

DO NOT attempt to use:

- Next.js
- Next.js App Router
- MetaMask
- Rabby
- WalletConnect
- external PostgreSQL/MySQL/etc.
- a conventional Node/Express backend

The game itself is hosted separately on itch.io:

<https://youngstunners88.itch.io/lil-blunt-adventure>

The purpose of smokegame.win is to be the official Web3 hub and companion portal for Lil Blunt Adventure.

This site must NOT replace the game.

The primary conversion goal is to get visitors to play the game.

The secondary goals are:

- explore the Lil Blunt universe
- understand the ecosystem
- view the leaderboard
- view Proof-of-Play achievements
- explore the Vault/lore
- optionally authenticate with Internet Identity
- view ecosystem/token information
- eventually connect game progress to persistent ICP identity

=====

1. BRAND POSITIONING

=====

Product name:

Lil Blunt: The Smoke Realm

Brand personality:

- chill
- irreverent
- mysterious
- confident
- playful
- cyberpunk
- crypto-native without being crypto-bro
- game-first

Core phrase:

"Chill vibes only. You can't tax the vibe."

CRITICAL BRAND RULE:

The game must be understandable and attractive to people who know nothing about cryptocurrency.

Do NOT make the site feel like a token presale page.

The game is the hero.

Web3 is the underlying ecosystem.

=====

2. VISUAL DIRECTION

=====

Create a premium dark-mode interface.

Visual language:

- deep void black
- dark purple
- neon Smoke green
- diamond blue
- metallic gold
- subtle white highlights
- glassmorphism

- soft neon bloom
- atmospheric smoke
- subtle particles
- retro-futuristic HUD elements
- pixel/game-inspired details
- cinematic depth
- restrained animation

Avoid:

- generic crypto landing-page aesthetics
- excessive gradients
- excessive glowing borders
- clutter
- casino aesthetics
- generic corporate SaaS layouts

The site should feel like:

"A secret interface from inside the Lil Blunt universe."

Use generous negative space.

Typography should be bold, highly readable and game-oriented.

=====

3. GLOBAL NAVIGATION

=====

Sticky glass navigation.

Left:

LIL BLUNT
THE SMOKE REALM

Navigation:

PLAY
ECOSYSTEM
LEADERBOARD
FEATS
VAULT

Right:

CONNECT INTERNET IDENTITY

The Connect button must use Internet Identity.

Do not display non-functional MetaMask/Rabby/WalletConnect buttons.

Mobile navigation must collapse into a polished menu.

=====

4. HERO SECTION

=====

This is the most important section.

Headline:

LIL BLUNT:
THE SMOKE REALM

Supporting text:

A chaotic 2D platformer where smoke, diamonds, gold and crypto collide.

Primary CTA:

PLAY NOW

Link:

<https://youngstunners88.itch.io/lil-blunt-adventure>

The PLAY NOW button should be visually dominant.

Secondary CTA:

EXPLORE THE REALM

Hero visual:

Create a cinematic Lil Blunt-inspired game environment using the project's visual identity.

Use:

- smoke
- neon green glow
- pixel-art/platformer atmosphere
- distant environmental depth
- subtle floating particles

Animation:

- slow smoke movement
- subtle parallax
- restrained particle movement

- CTA hover animation
- content reveal animation

Do NOT make the animation interfere with readability.

=====

5. GAME-FIRST STRIP

=====

Immediately underneath the hero, show three extremely clear propositions:

PLAY

Jump. Dash. Fight. Survive.

EXPLORE

Smoke Realm → Crystal Realm → Gold Rush.

CONQUER

Defeat bosses. Discover secrets. Set high scores.

Add small animated icons.

=====

6. THE GAME WORLDS

=====

Create a cinematic three-card section.

CARD 1

SMOKE REALM

Theme:

SmokeRing

Visual:

Green smoke, neon, urban/psychedelic environment.

Description:

"Lil Blunt's home turf."

CARD 2

DIAMOND REALM

Theme:

DIAMONDS

Visual:

Crystal caves, blue light, reflections.

Description:

"Deep underground. Nothing stays buried."

CARD 3

GOLD RUSH

Theme:

GoldMine

Visual:

Gold, steel, mining infrastructure, Western atmosphere, Bitcoin-orange highlights.

Description:

"Mine deep. Survive the rush."

Cards should animate on scroll and expand subtly on hover.

=====
7. DEMAND CASCADE
=====

Create an interactive ecosystem section titled:

THE DEMAND CASCADE

Use a sequential visual flow:

BLAZE

↓

DIAMONDS

↓

GOLD

STEP 1 — BLAZE

Explain the upstream role.

STEP 2 — DIAMONDS

Explain how Diamonds interact with the ecosystem.

STEP 3 — GOLD

Explain Gold's role in the Gold Rush / Vault ecosystem.

IMPORTANT:

Do NOT hard-code unverified token supply numbers or economic claims into the application.

Create a typed configuration/data model so values can later come from an authoritative backend.

Every live metric should support:

- value
- label
- source
- last updated
- optional tooltip

Show "LIVE DATA" only when data is actually connected.

Otherwise show:

"ECOSYSTEM DATA — DEMO"

Do not present mocked economic information as real.

Use Framer Motion or an equivalent supported React animation library for sequential scroll animation.

=====

8. TOKENOMICS DASHBOARD

=====

Create a polished dashboard showing:

SMOKE
DIAMONDS
GOLD

For each asset prepare UI fields for:

- supply
- circulating
- burned
- locked
- staked
- utility

Use mock data initially but clearly label it as:

DEMO DATA

Design the data layer so these fields can later be populated from an ICP canister or external API.

=====

9. LEADERBOARD

=====

Create:

THE SMOKE REALM LEADERBOARD

Table columns:

Rank
Player
Score
Stage
Bosses Defeated
Achievements

Use mock records initially.

Clearly label:

DEMO LEADERBOARD

Include:

CONNECT INTERNET IDENTITY

After authentication, the architecture should support associating a player identity with their profile.

Design the backend data model for:

PlayerProfile
PlayerScore
RunRecord
Achievement
LeaderboardEntry

Do not trust browser-submitted scores as authoritative.

Prepare the model for server-side validation.

=====

10. PROOF OF PLAY

=====

Create an achievement gallery.

Cards:

THE AUDITOR SLAYER

Defeat the Stage 1 boss without taking damage.

BLAZE RUSH CHAMPION

Complete the bonus corridor with 100% collection.

FORT KNOX WHALE

Meet the required Gold staking threshold.

SMOKE LOUNGE VIP

Unlock Smoke Lounge access.

Each card should include:

- artwork
- title
- rarity
- requirement
- locked/unlocked visual state
- progress indicator

Make the system extensible for future achievements.

Do NOT describe achievements as minted NFTs unless the backend actually supports minting.

Use "Proof of Play" as the gameplay achievement layer.

=====

11. THE VAULT

=====

Create an immersive lore/mechanics section.

Use expandable cards or accordions.

Sections:

THE HANDLER

BONG PARTIES

THE LOUNGE

FORT KNOX

GOLD RUSH

The UI should distinguish:

LORE
GAME MECHANIC
ECONOMIC MECHANIC

Do not imply a mechanism is live unless it actually exists.

Use badges:

LIVE
IN DEVELOPMENT
LORE
COMING SOON

=====

12. SOCIAL / COMMUNITY

=====

Create a community section.

Include placeholders for:

X
Telegram
GitHub
Discord

Use clean icon buttons.

Do not fabricate URLs.

=====

13. FOOTER

=====

Footer:

Lil Blunt: The Smoke Realm

Links:
Play Game
Ecosystem
Leaderboard
Proof of Play
Vault
GitHub
X
Telegram

Legal/disclaimer:

"Web3 gaming involves risk. Play responsibly."

Also include:

"Crypto and ecosystem information is provided for informational purposes and is not financial advice."

=====

14. RESPONSIVE DESIGN

=====

The site must be excellent on:

- desktop
- tablet
- mobile

The mobile experience is NOT a simplified desktop page.

Create mobile-specific hierarchy.

The PLAY NOW button must remain highly visible.

Tables should become cards or horizontally scrollable panels.

Glass effects must remain performant.

=====

15. ANIMATION SYSTEM

=====

Use restrained premium motion.

Include:

- hero entrance
- scroll reveal
- staggered ecosystem cards
- Demand Cascade sequential animation
- leaderboard row hover
- achievement card interaction
- vault accordion transitions
- button micro-interactions
- subtle ambient smoke

Animations should respect reduced-motion preferences.

Do not over-animate.

=====

16. COMPONENT ARCHITECTURE

=====

Organize the project into reusable components.

Suggested structure:

```
components/  
  Navigation  
  Hero  
  GameWorlds  
  Ecosystem  
  Tokenomics  
  Leaderboard  
  ProofOfPlay  
  Vault  
  Community  
  Footer  
  GlassCard  
  NeonButton  
  StatCard  
  AchievementCard  
  LeaderboardTable
```

Create typed models for:

```
Token  
TokenMetric  
PlayerProfile  
LeaderboardEntry  
Achievement  
VaultEntry  
World
```

=====

17. DATA ARCHITECTURE

=====

Separate UI from data sources.

Create clear interfaces so mock data can later be replaced without redesigning components.

Prepare repository/data access abstractions for:

getLeaderboard()
getPlayerProfile()
getAchievements()
getTokenMetrics()
getVaultData()

Use demo data initially.

Every demo value must be clearly identifiable in the UI.

=====

18. PERFORMANCE

=====

Prioritize:

- fast first paint
- responsive navigation
- lazy-loaded visual assets
- reduced unnecessary animation
- optimized generated imagery
- minimal blocking work
- mobile performance

The site should feel like a polished game portal, not a heavy crypto dashboard.

=====

19. SEO / DISCOVERABILITY

=====

Create:

Title:

Lil Blunt: The Smoke Realm | Web3 2D Platformer

Description:

Enter the Smoke Realm. Play Lil Blunt Adventure, defeat the Tax Man, explore three realms and discover the Web3 ecosystem behind the game.

Use semantic headings.

Include Open Graph metadata where supported by Caffeine.

=====

20. SECURITY / TRUST

=====

Never expose secrets.

Never place API keys in frontend code.

Never treat browser-submitted leaderboard scores as trusted.

Never present demo tokenomics as live economic data.

Never claim an NFT has been minted unless the backend confirms it.

Never imply wallet connectivity works when it does not.

=====

21. FINAL PRODUCT REQUIREMENT

=====

The final site should make a first-time visitor think:

"I need to play this."

It should NOT make them think:

"Another crypto token website."

The page should feel like:

A GAME FIRST.

A WORLD SECOND.

A WEB3 ECOSYSTEM THIRD.

The most important CTA on the entire website is:

PLAY NOW

Link directly to:

<https://youngstunners88.itch.io/lil-blunt-adventure>

Build the initial working version now with polished responsive UI, reusable components, demo data clearly marked, Internet Identity-ready authentication architecture, and an extensible backend/data model.
